# L01: Introduction to HPC

- Stefano Cozzini
- CNR-IOM and eXact lab srl

# Agenda

- Prologue: why and where HPC ?
  - What is HPC ?
  - Definitions & metrics
- What is HPC infrastructure ?
  - Parallel machines
  - Supercomputers & HPC Cluster
- Measure Performance
- HPC on the Cloud ?

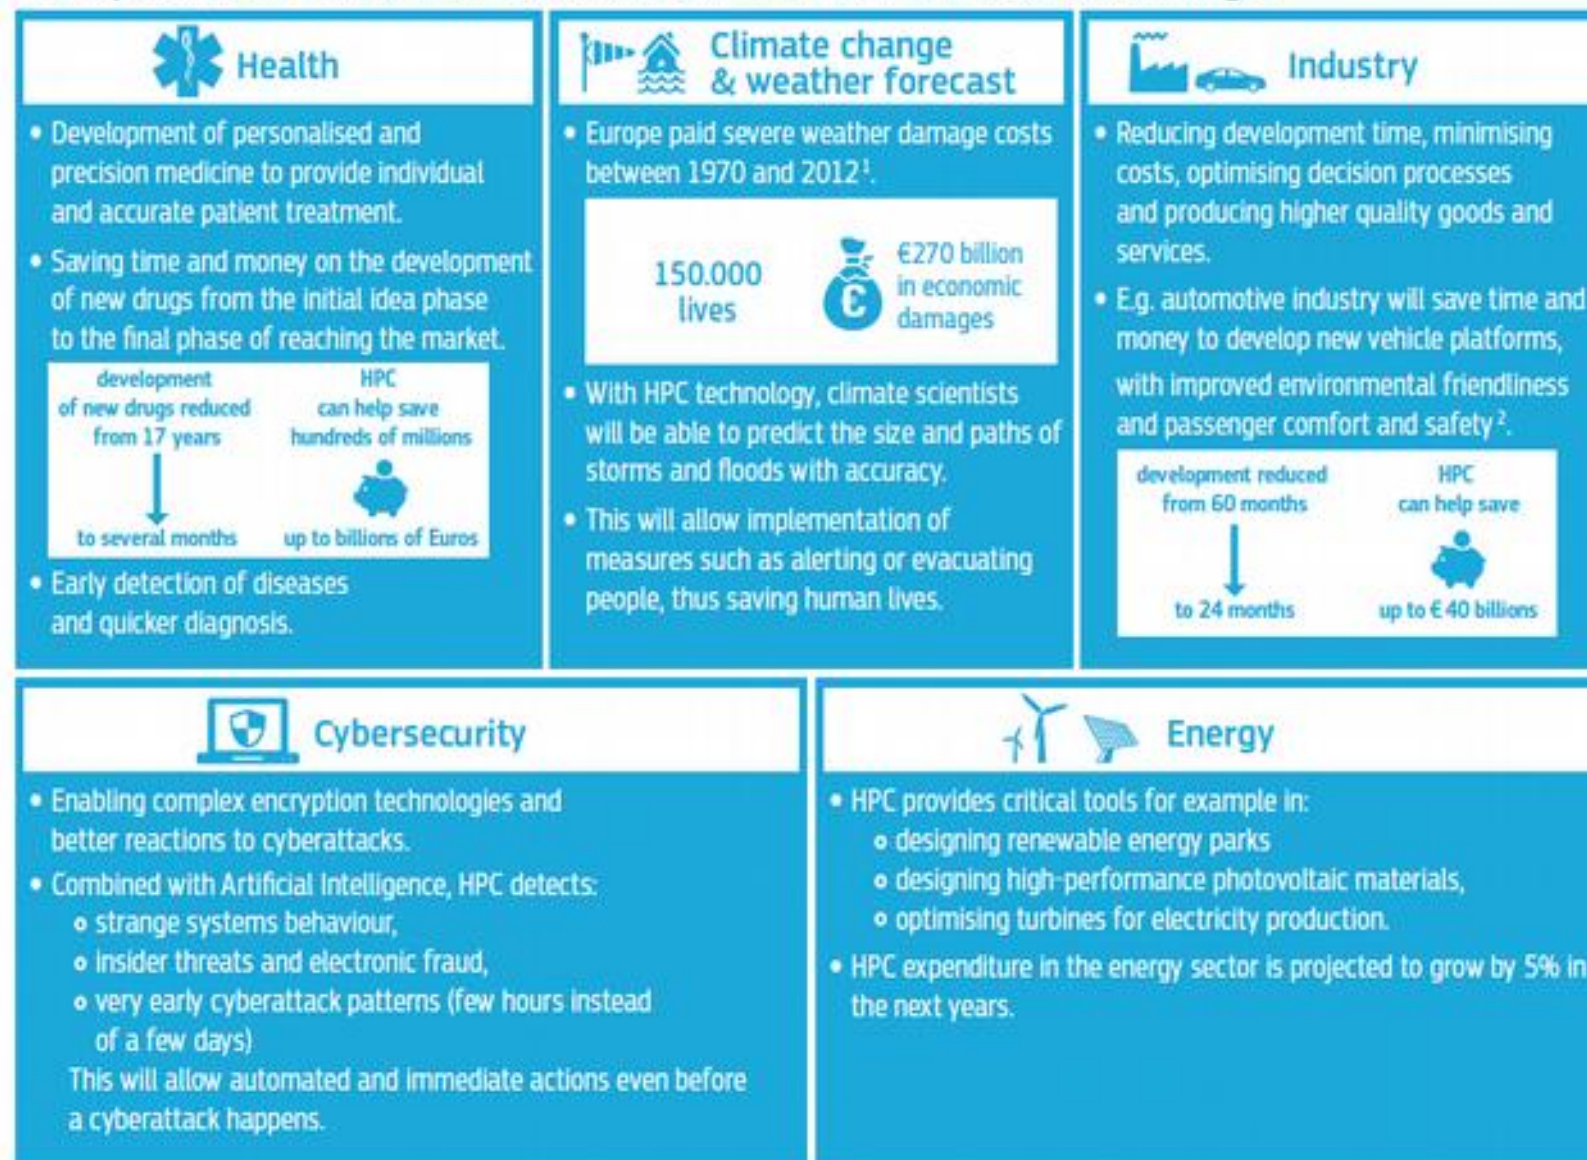

# HPC: the challenge..

- Societal, scientific and economic needs are the drivers for the next generation of HPC - computing with **exascale performance** (computers capable of performing  $10^{18}$  floating point operations per second).
- All scientific disciplines are becoming "computational" today. Modern scientific discovery requires very high computing power and capability to deal with huge volumes of data.
- Industry and SMEs are increasingly relying on the power of supercomputers to invent innovative solutions, reduce cost and decrease time to market for products and services.
- HPC is part of a global race. Many countries (USA, Japan, Russia, China, Brazil, India) have announced ambitious plans for building the next generation of HPC with exascale performance and deploying state-of-the-art supercomputers.

From <https://ec.europa.eu/programmes/horizon2020/en/h2020-section/high-performance-computing-hpc>

# A few example where to apply HPC

HPC capabilities are used to solve and address scientific, industrial and societal challenges.

# A slogan...

Out compute

=

Out compete

Image from UberCloud

# HPC: A first definition

- Defining HPC (from Intersect survey)
    - High Performance Computing (HPC) is the **use of servers, clusters, and supercomputers** – plus **associated software, tools, components, storage, and services** – for **scientific, engineering, or analytical tasks** that are particularly intensive in computation, memory usage, or data management
    - HPC is used by scientists and engineers both in research and in production across **industry, government** and **academia**.
- [to be continued]

# Elements of the HPC...

- use of servers, clusters, and supercomputers  
→ HARDWARE
- associated software, tools, components, storage, and services  
→ SOFTWARE
- scientific, engineering, or analytical tasks  
→ PROBLEMS TO BE SOLVED..

ALL THE ABOVE DEFINES A  
COMPUTATIONAL  
INFRASTRUCTURE  
aka E-INFRASTRUCTURE

# Elements of an HPC infrastructure

- High end computational servers + accelerators
- High speed networks
- High end parallel storage
- Middleware
- Scientific/Technical/ Data analysis software
- Research/Technical data
- Problems to be solved

IS ALL WHAT WE NEED ?

# Last but not least: people

- Human capital is by far the most important aspect
- Two important roles:
  - HPC providers
    - (plan/install/manage HPC resources)
  - HPC user : Main focus of the
    - use at best HPC resource

MIXING/INTERPLAYING ROLES  
INCREASES COMPETENCE LEVELS

# From infrastructure to ecosystem

- Goal:
  - provide a computational ecosystem to satisfy all the different requirements posed by **users**
- Which kind of requirements ?
  - All you need to to solve their computational problems !

# Which kind of users ?

- Computational scientists
- Industries with computational tasks
- Scientists with a lot of (different) data
- Industries with a lot of (different) data

Variety

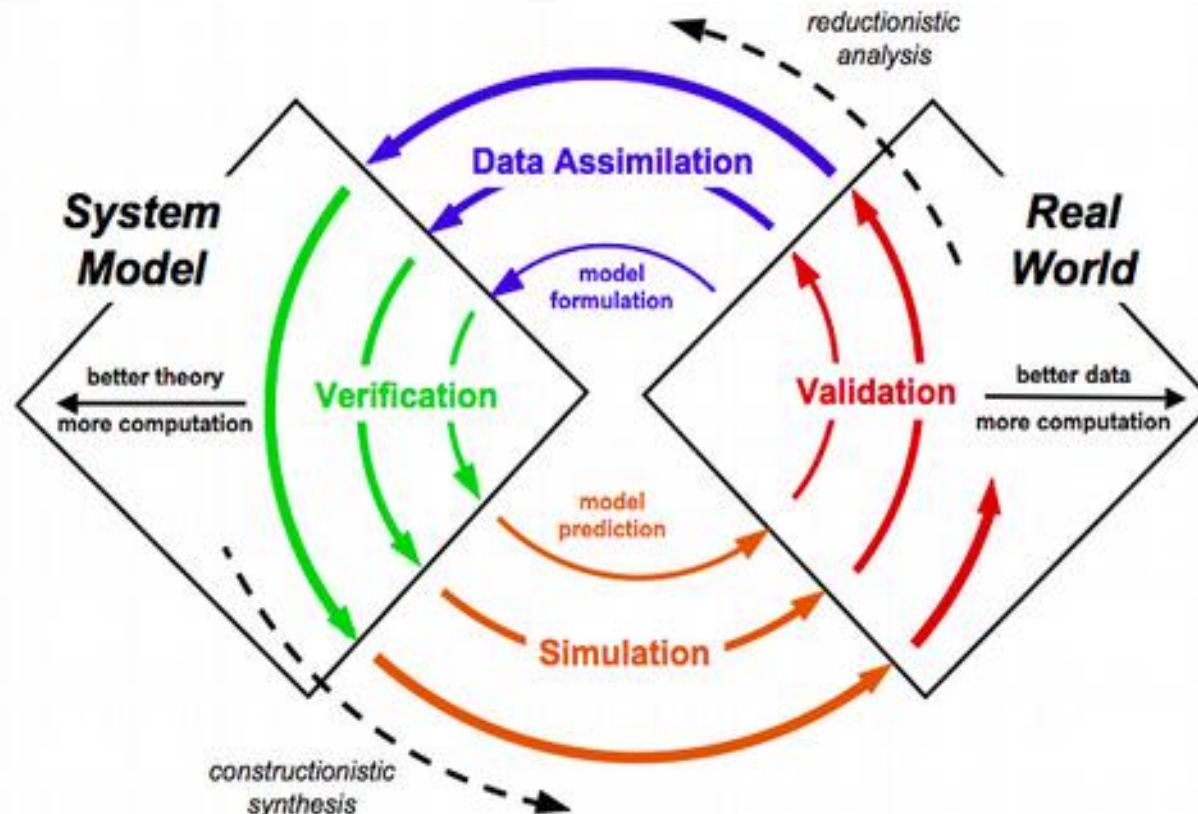

# Challenges ahead HPC (I)

- HPC skilled people

# Research is changing...

- Inference Spiral of System Science
  - As models become more complex and new data bring in more information, we require ever increasing computational power

# Applications requires more data everyday..

- Simulation has become the way to research and develop new scientific and engineering solutions.
  - Used nowadays in leading science domains like aerospace industry, astrophysics, etc.
- Challenges related to the complexity, scalability and data production of the simulators arise.
  - Impact on the relaying IT infrastructure.

# BIG DATA buzzword..

Sources: McKinsey Global Institute, Twitter, Cisco, Gartner, EMC, SAS, IBM, MEPTEC, GSA

IBM

# Data Intensive Science

- A fourth paradigm after experiment, theory and computation

## The Fourth Paradigm: Data-Intensive Scientific Discovery

Presenting the first broad look at the rapidly emerging field of data-intensive science

Increasingly, scientific breakthroughs will be powered by advanced computing capabilities that help researchers manipulate and explore massive datasets.

The speed at which any given scientific discipline advances will depend on how well its researchers collaborate with one another, and with technologists, in areas of eScience such as databases, workflow management, visualization, and cloud computing technologies.

In *The Fourth Paradigm: Data-Intensive Scientific Discovery*, the collection of essays expands on the vision of pioneering computer scientist Jim Gray for a new, fourth paradigm of discovery based on data-intensive science and offers insights into how it can be fully realized.

Critical praise for *The Fourth Paradigm*

# Big data challenge: from HPC to HPDA through AI

- Organizations are expanding their definitions of high-performance computing (HPC) to include workloads such as artificial intelligence (AI) and high-performance data analytics (HPDA) in addition to traditional HPC simulation and modeling workloads.

From <https://insidebigdata.com/2019/07/22/converged-hpc-clusters/>

# Different software ecosystems for HDA and traditional computational science.

From [https://www.exascale.org/bdec/sites/www.exascale.org.bdec/files/whitepapers/bdec\\_pathways.pdf](https://www.exascale.org/bdec/sites/www.exascale.org.bdec/files/whitepapers/bdec_pathways.pdf)

# Challenges ahead HPC (II)

- HPC skilled people
- BIG data: no longer HPC but HPDA/AI as well

# Is it all about Performance ?

Quantifying "performance"

- It is difficult to define **Performance** properly
- “speed” / “how fast” are vague terms
- **Performance** as a measure again ambiguous and not clearly defined and in its interpretation
- In any case performance it is at core to HPC as a discipline
- Let discuss it in some details

Also: H(P)C; P = productivity/profitability

# Does P stand just for Performance ?

- Performance is not always what matters..  
to reflect a greater focus on the **productivity**, rather than just the performance, of large-scale computing systems, many believe that HPC should now stand for **High Productivity Computing**.
- [ from wikipedia]
- P should also stand for **PROFITABILITY**

# Performance vs Productivity

- A possible definition:  
$$\text{Productivity} = (\text{application performance}) / (\text{application programming effort})$$
- people in HPC arena have different goals in mind thus different expectations and different definitions of productivity.

**Question: Which kind of productivity are you interested in ?**

# Another HPC definition

- HPC incorporates all facets of three disciplines:
  - Technology
  - Methodology
  - Application

The main defining property and value provided by HPC is delivering **performance** for **end-user application**

At page 39

Let us focus on an high performance problem..

picture from <http://www.f1nutter.co.uk/tech/pitstop.php>

# Analysis of the parallel solution

## FUNCTIONAL PARTITIONING

**different people are executing different tasks**

## DOMAIN DECOMPOSITION

**different people are solving the same global task but on smaller subset**

HPC  
=  
Parallel  
computing

HPC  
=  
Parallel  
hardware

# Parallel computers

- Tons of different machines !
- Flynn Taxonomy (1966): helps (?) us in classifying them:
  - Data Stream
  - Instruction Stream

		Instruction stream	
		Single	Multiple
Data stream	Single	SISD v. Neumann machine	MISD Very rare
	Multiple	SIMD 1 instr -> many data(domain d	MIMD Functional partitioning

# Flynn Taxonomy (graphical view)

# Another important question:

- MEMORY: The simplest and most useful way to classify modern parallel computers is by their memory model:

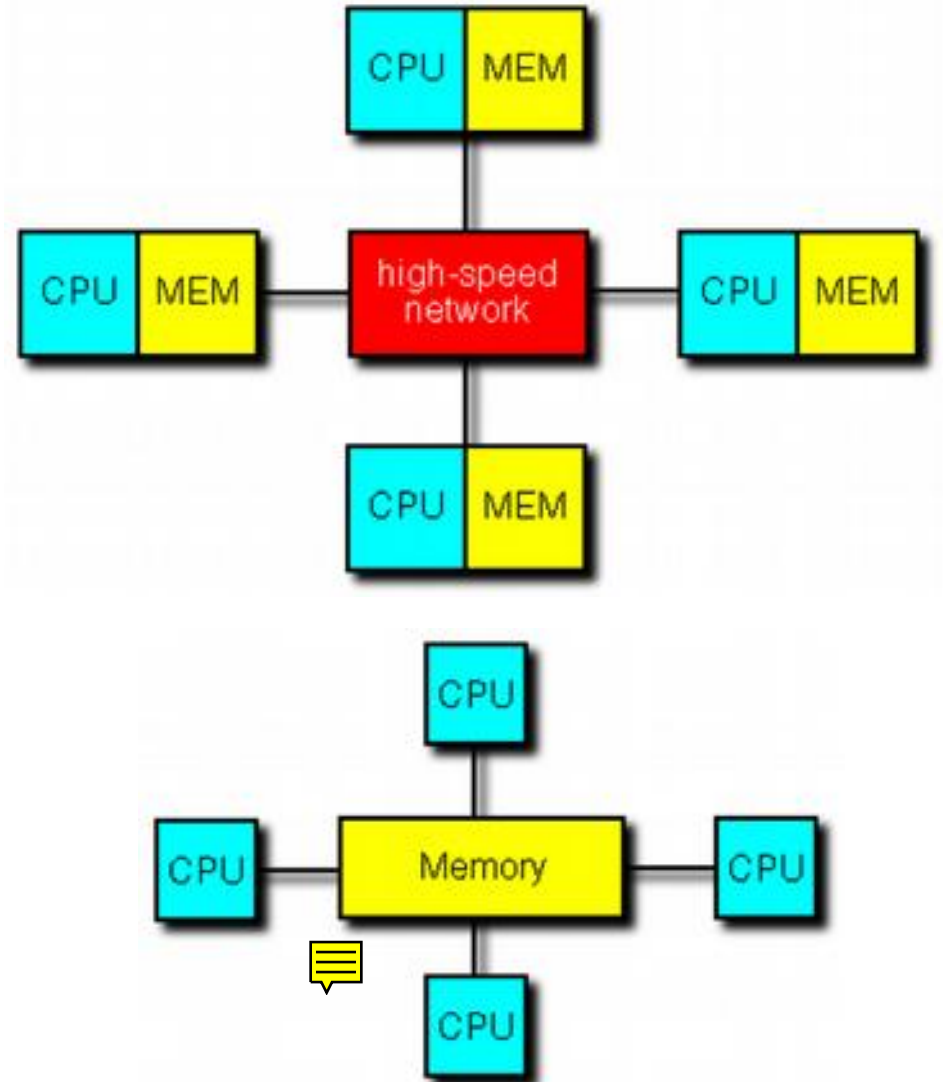

☰ SHARED MEMORY Concurrent access to memory by many CPUs/cores

- DISTRIBUTED MEMORY MPI: message passing

- MIXED SITUATION Most common today in HPC

# Shared vs Distributed memory

- Distributed memory
  - each processor has its own local memory. Must do message passing to exchange data between processors
- Shared Memory
  - single address space. All processors have access to a pool of shared memory.

# Shared memory: UMA vs NUMA

- *Uniform memory access (UMA)*:  
Each processor has uniform access to memory. Also known as  symmetric multiprocessors (*SMP*)
- *Non-uniform memory access (NUMA)*: Time for memory access depends on location of data. Local access is faster than non-local access.

# Distributed memory machines

- The memory is physically distributed among the processors (local memory). Each processor can access directly only to its own local memory

NO-Remote Memory Access (NORMA) model

- Communication among different processors occurs via a specific communication protocol (message passing).

# The basic distributed memory machine: clusters

- Several computers (nodes) often in special cases for easy mounting in a rack
- One or more networks (interconnects) to hook the nodes together
- Storage facilities.

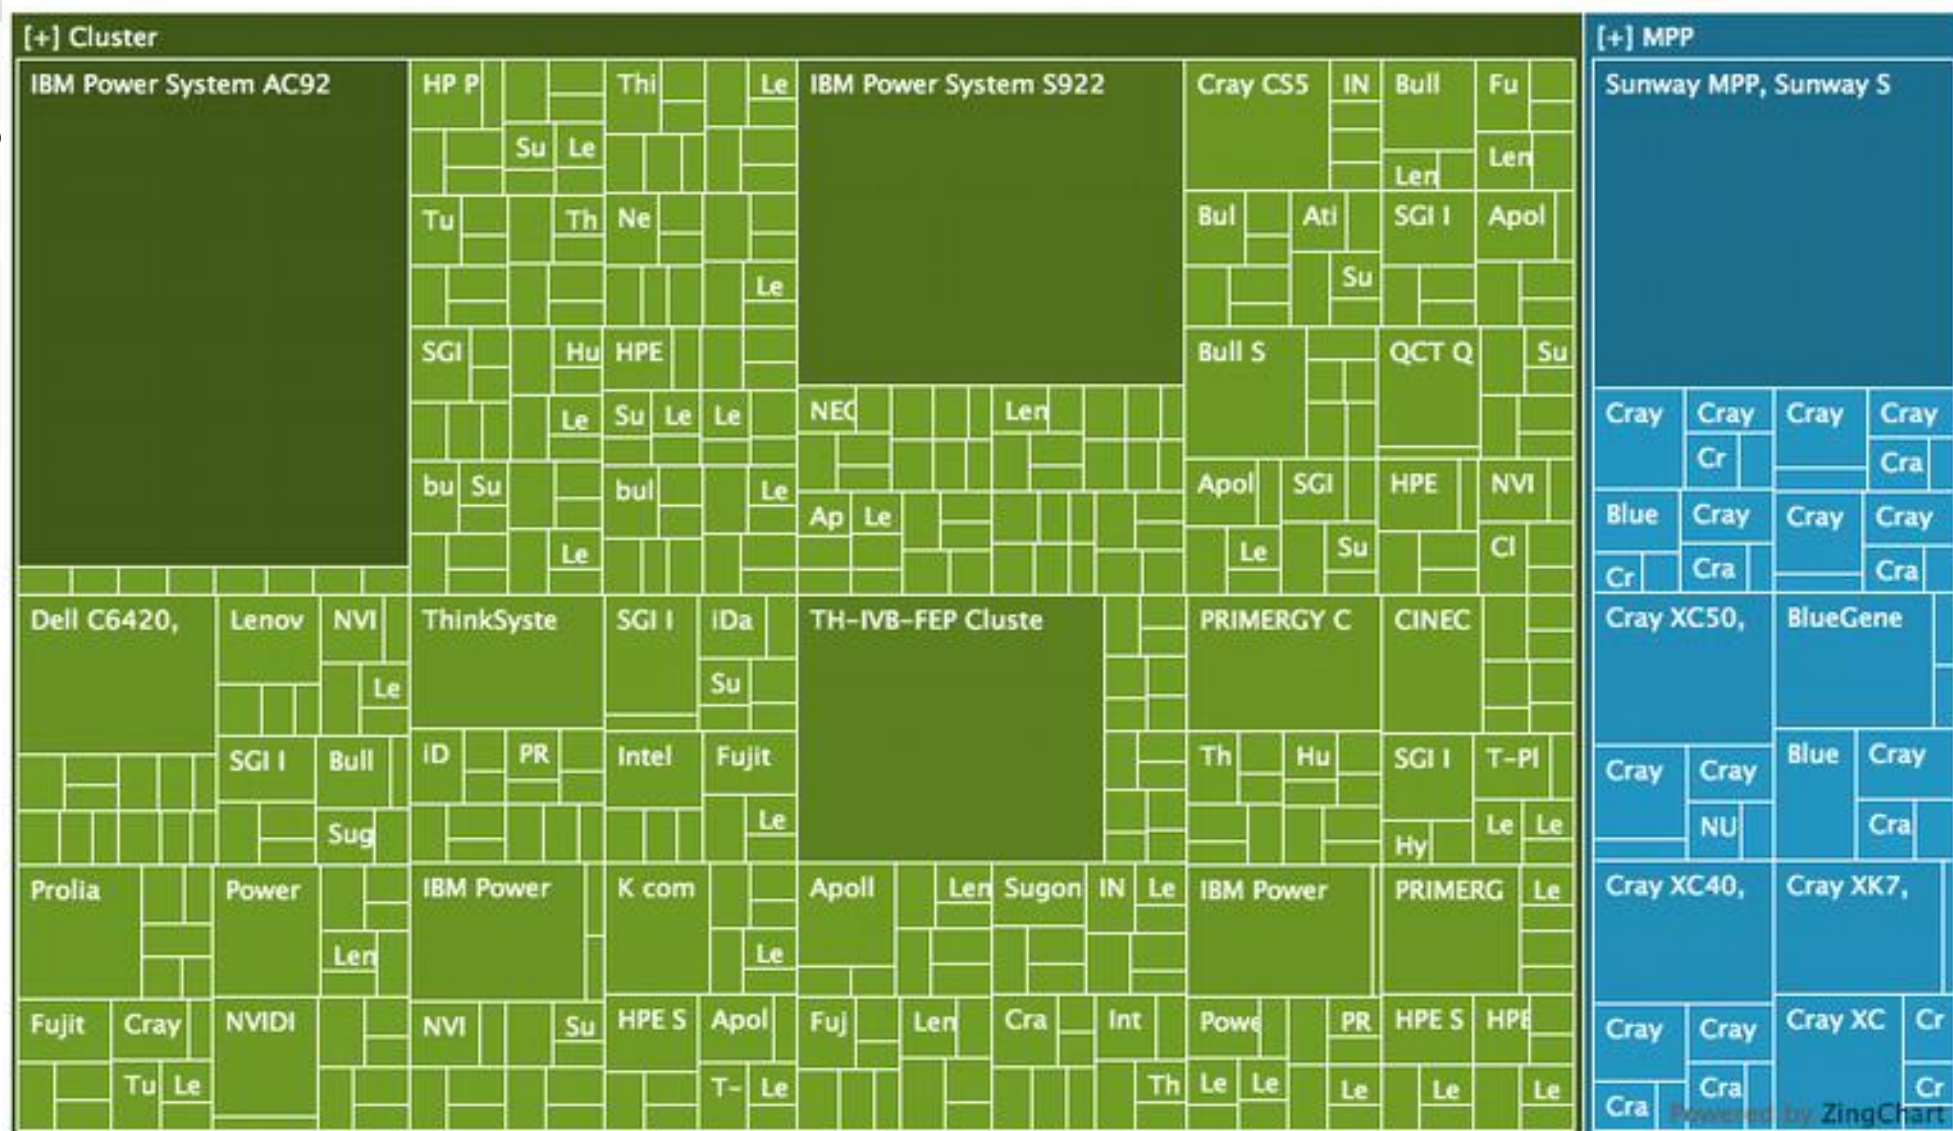

# The basic distributed memory machine: clusters

- The performance of the system are influenced by:
  - Features of the node (RAM/cores/CPU frequency/ accelerator)
  - Features (Topology and other) of the interconnection network

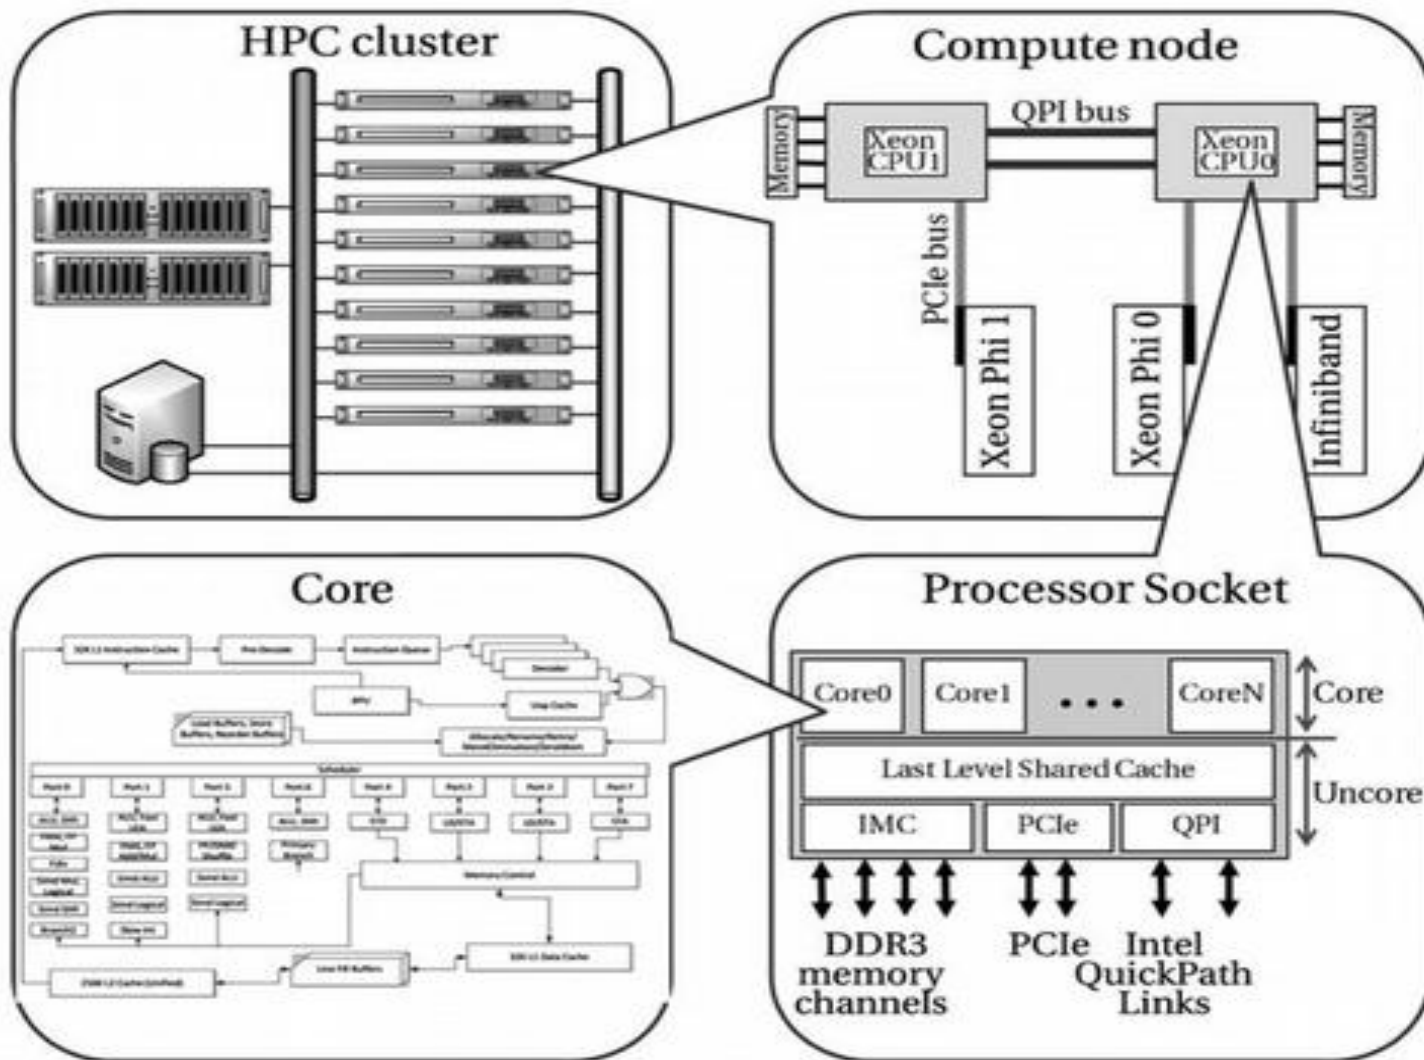

# Which architecture for HPC in 2019 ?

# The building blocks of the HPC cluster

# A (not so) modern node of a cluster (Ulysses)

Machine: (1800B)

Host: cn08-19

Indexes: physical

Date: Wed Sep 16 11:06:52 2015

# HPC jargon

- Multiprocessor = server with more than 1 CPU
- Multicore= a CPU with more than 1 core
- Processor = CPU =socket
- BUT SOMETIME:
  - Processor= core
  - a process for each processor ( i.e. each core)

# Challenges ahead HPC (III)

- HPC skilled people
- BIG data: no longer HPC but HPDA/AI as well
- Complex and multicomponent HPC systems

# Measuring speed of HPC systems

- How fast can I crunch numbers on my CPUs ?
- How fast can I move data around ?
  - from CPUs to memory
  - from CPUs to disk
  - from CPUs on different machines
- How much data can I store ?

# Number crunching on CPU: what do we count ?

- Rate of [million/billions of] floating point operations per second ([M|G]flops) FLOPs/S
- **Theoretical peak performance:**
  - determined by counting the number of floating-point additions and multiplications that can be completed during a period of time, usually the cycle time of the machine

$$\text{FLOPS} = \text{Clock-rate} * \text{Number\_of\_FP\_operation} * \text{Number\_of\_cores}$$

# Sustained (peak) performance

## Real (sustained) performance: a measure

measured by taking the time the code requires to run

$$\frac{(\text{Number\_of\_floating\_point\_operations of the code})}{\text{Time measured}}$$

**Number\_of\_floating\_point\_operations** not easy to be defined for real application:

benchmarks are available for that..

Top500 list uses HPL Linpack:

Sustained peak performance is what's matter in TOP500

# TOP 500 List

- The TOP500 list [www.top500.org](http://www.top500.org)
- published twice a year from 1993
  - ISC conference in Europe (June)
  - Supercomputing conference in USA (November)
- List the most powerful computers in the world
- yardstick: Linpack benchmark (LU – decomposition)

# HPL: some details

From <http://icl.cs.utk.edu/hpl/index.html>:

The code solves a uniformly random system of linear equations and reports time and floating-point execution rate using a standard formula for operation count.

Number\_of\_floating\_point\_operations =  $\frac{2}{3}n^3 + 2n^2$  (n=size of the system)

T/V	N	NB	P	Q	Time	Gflops
WR03R2L2	86000	1024	2	1	191.06	2.219e+03
Ax-b  _oo/(eps*(  A  _oo*  x  _oo+  b  _oo)*N)=					0.0043644 .....	<b>PASSED</b>

- For each machine the following numbers are reported using HPL:
  - **Rmax**: the performance in GFLOPS for the largest problem run on a machine.
  - **Rpeak**: the theoretical peak performance GFLOPS for the machine.
  - The measure of the **power** required to run the benchmark

# And the winner is...

# 06/2019 Highlights (from TOP500)

The top of the list remains largely unchanged, with only two new entries in the top 10, one of which was an existing system that was upgraded with additional capacity.

- Two IBM-built supercomputers, Summit and Sierra, installed at the Department of Energy's Oak Ridge National Laboratory (ORNL) in Tennessee and Lawrence Livermore National Laboratory in California, respectively, retain the first two positions on the list. Both derive their computational power from Power 9 CPUs and NVIDIA V100 GPUs. **The Summit system slightly improved its HPL result from six months ago, delivering a record 148.6 petaflops, while the number two Sierra system remains unchanged at 94.6 petaflops.**
- The Sunway TaihuLight, a system developed by China's National Research Center of Parallel Computer Engineering & Technology (NRCPC) and installed at the National Supercomputing Center in Wuxi, holds the number three position with **93.0 petaflops**. It's powered by more than 10 million SW26010 processor cores.
- At number four is the Tianhe-2A (Milky Way-2A) supercomputer, developed by China's National University of Defense Technology (NUDT) and deployed at the National Supercomputer Center in Guangzhou. It used a combination of Intel Xeon and Matrix-2000 processors to achieve an HPL result of 61.4 petaflops.
- Frontera, the only new supercomputer in the top 10, attained its number five ranking by delivering 23.5 petaflops on HPL. The Dell C6420 system, powered by Intel Xeon Platinum 8280 processors, is installed at the Texas Advanced Computing Center of the University of Texas.

# PERFORMANCE DEVELOPMENT

# Sustained peak performance on real scientific codes

Blue-waters at NCSA: 22,640 AMD 6276 processors

Theoretical peak performance: 13 Petaflops

Sustained performance on real scientific codes:..

Scientific code	Number of cores	Performance achieved(PF)	runtime (hour)
VPIC	22528	1.25	2.5
PPM	21417	1.23	~ 1
QMCPACK	22500	1.037	~1
SPECF3MD	21675	>1	Not reported
WRF	8192	0,160	<0.50

<http://www.cray.com/sites/default/files/resources/XE6-NCSA-PFApplications-0514.pdf>

# Why Performance degradation ?

- HPC system is unable to exploit all the resources all of the time
- Many different causes and many parts of the HPC are responsible all together
- At abstract level four important factors:
  - Starvation
  - Latency
  - Overhead
  - Waiting for Contention => SLOW

# Starvation

- Happens when sufficient work is not available at any instance in time to support issuing instructions to all functional units every cycle.
- Typical case:
  - Not enough parallel work for all processors/components
  - Parallel work not evenly distributed among all processors/components (load is not balanced)

# Latency

- Time it takes for information to move from one part of the system to the other.
- Typical cases:
  - Memory access
  - Data transfer between separate nodes
- Lot of tricks to hide latency (see next lectures)

# Overhead

- The amount of additional work needed beyond that which is actually required to perform the computation.
- Typical cases:
  - Time to spawn and synchronize parallel tasks
  - Other kind of operation not directly associated to the computation
- The above operations steals resources to the computation and should be minimized

# Waiting for contention

- Two or more request are made at the same time on the same resource (either HW or SW)..
- Typical cases:
  - Two task writing on the same disk and/or sending message to the same memory location at the same time
- Generally such events are not predictable and so difficult to avoid and to optimize.

# Challenges ahead HPC (IV)

- HPC skilled people
- BIG data: no longer HPC but HPDA/AI as well
- Complex and multicomponent HPC systems
- Sustained performance not just HPL !!!

# From twitter..

# Exercise 0..

- 0.1 Compute Theoretical Peak performance for your lap top/desktop
  - Identify the CPU
  - Identify the frequency
  - Identify the number of floating point for cycle
  - Identify how many cores
  - Put all together in one single number and tell me
- 0.2 compute sustained Peak performance for your cell-phone
  - Identify an app to run HPL
  - Run it & Tune it to get the best number you can
- 0.3 Find out in which year your cell phone/laptop could have been in top1% of Top500

# Moving data around: bits and Mb/sec

- within the node:
  - CPU-Memory: thousand of Mb/sec  
GByte/sec
    - 10 - 100 Gbit
  - CPU- Disks : MByte/sec
    - 50 ~ 100 MB up 1000MB/sec
- Among node (cluster)
  - networks
    - default (commodity)
      - 1000Mbit=1Gbit
    - custom(high speed)
      - 10Gb and now 100 Gb (and even more)

# About network for cluster

- The performance of the network cannot be ignored
  - Latency: Initialization time before data can be sent
  - Per-link Peak Bandwidth: Maximum data transmission rate (varies with packet size)
  - Topology: how the network is done.

# Latency&bandwidth

NETWORK	Latency	Bandwidth (GB/sec)
Gigabit	70-40	~ 0.125
10G	<5	~1.250
Infiniband 4DDR	~1.5/1.9	~ 3.2
Infiniband FDR	<1.0	~ 5

What is the UNIT OF MEASURE OF LATENCY ?

Microseconds: 3 order of magnitude larger than unit of measure of FP operations

# Storage size: bytes

- size of storage devices:
  - Kbyte/Mbyte --> caches/RAM
  - Gigabyte ---> RAM/hard disks(small size)
  - Terabyte ---> Disks/SAN
  - Petabyte ----> SAN / Tapes devices

# Last but not least: Storage

- High Speed Storage is required for HPC
  - Parallel Filesystem is mandatory:
    - Lustre/GPFS/BeeGFS etc..
- Hierarchical storage is also a solution:
  - Hierarchical storage management (HSM) is a data storage technique, which automatically moves data between high-cost and low-cost storage media.
    - First layer: SSD
    - Second layer : parallel FS
    - Third layer: SAN
    - Fourth layer: Tapes

# Gigabyte or gibibyte ?

- The gibibyte is a multiple of the unit byte for digital information. The binary prefix gibi means  $2^{30}$ , therefore one gibibyte is equal to 1073741824 bytes = 1024 mebibytes. The unit symbol for the gibibyte is GiB. Defined by the International Electrotechnical Commission (IEC) in 1998.
- The gibibyte is closely related to the gigabyte (GB), which is defined by the IEC as  $10^9$  bytes =  $1\text{GiB} \approx 1.074\text{GB}$ .
- 1024 gibibytes are equal to one tebibyte.
- In the context of computer memory, gigabyte and GB are customarily used to mean  $1024$  ( $2^{30}$ ) bytes, although not in the context of data transmission and **not necessarily for hard drive size**.

# IOPS vs FLOPS

- HPC is too compute-centric
- Modern Scientific&technical computing requires access to data and computing

computing 1 calculation  
 $\approx 1$  picojoule

moving 1 calculation  
 $\approx 100$  picojoule

Source: IDC Direction 2013

# How much energy do we need to run an exascale machine ?

- A lot !
- Exercise: compute how much energy you need to reach 1exaflop using #1 in 2012 /2015/2018

# Top500&Green500

- Over the last years , energy efficiency increased substantially
- BUT Exaflops machine today not yet sustainable in term of energy !
- Sustainability is set to 20MW !
- Though to be reached in 2018 now postponed to 2023
- Green500 is the Top500 reorder according to energy efficiency...

# The Ultimate Goal of “The Green500”

- Raise awareness of energy efficiency in supercomputing.
- Drive energy efficiency as a first-order design constraint (on par with FLOPS).

Encourage fair use of the list rankings to promote energy efficiency in high-performance computing systems.

# Top Green500 June 2019

# Highlights..

- The most energy-efficient system and No. 1 on the Green500 is the DGX SaturnV Volta system, a NVIDIA system installed at NVIDIA, USA. It achieve 15.1 GFlops/Watt power efficiency. It is on position 469 in the TOP500.
- They are followed on No 3 by Summit at the Oak Ridge National Laboratory (ORNL) in Tennessee. It achieved 14.7 gigaflops/watt and is listed at number one in the TOP500.
- The Shoubu system B, a ZettaScaler-2.2 system at the Advanced Center for Computing and Communication, RIKEN, Japan was decommissioned March 2019 and was removed from the TOP500 list.
- All the top 1% have accelerators installed...

# Power efficiency (1)

## POWER EFFICIENCY

# Power efficiency (max-efficiency)

## ENERGY EFFICIENCY

# Challenges ahead HPC (V)

# How much does it cost a computational infrastructure ?

- It is not just a matter of HW...
- Total Cost of Ownership is the right way to calculate the budget for an HPC infrastructure..

# Total Cost of Ownership

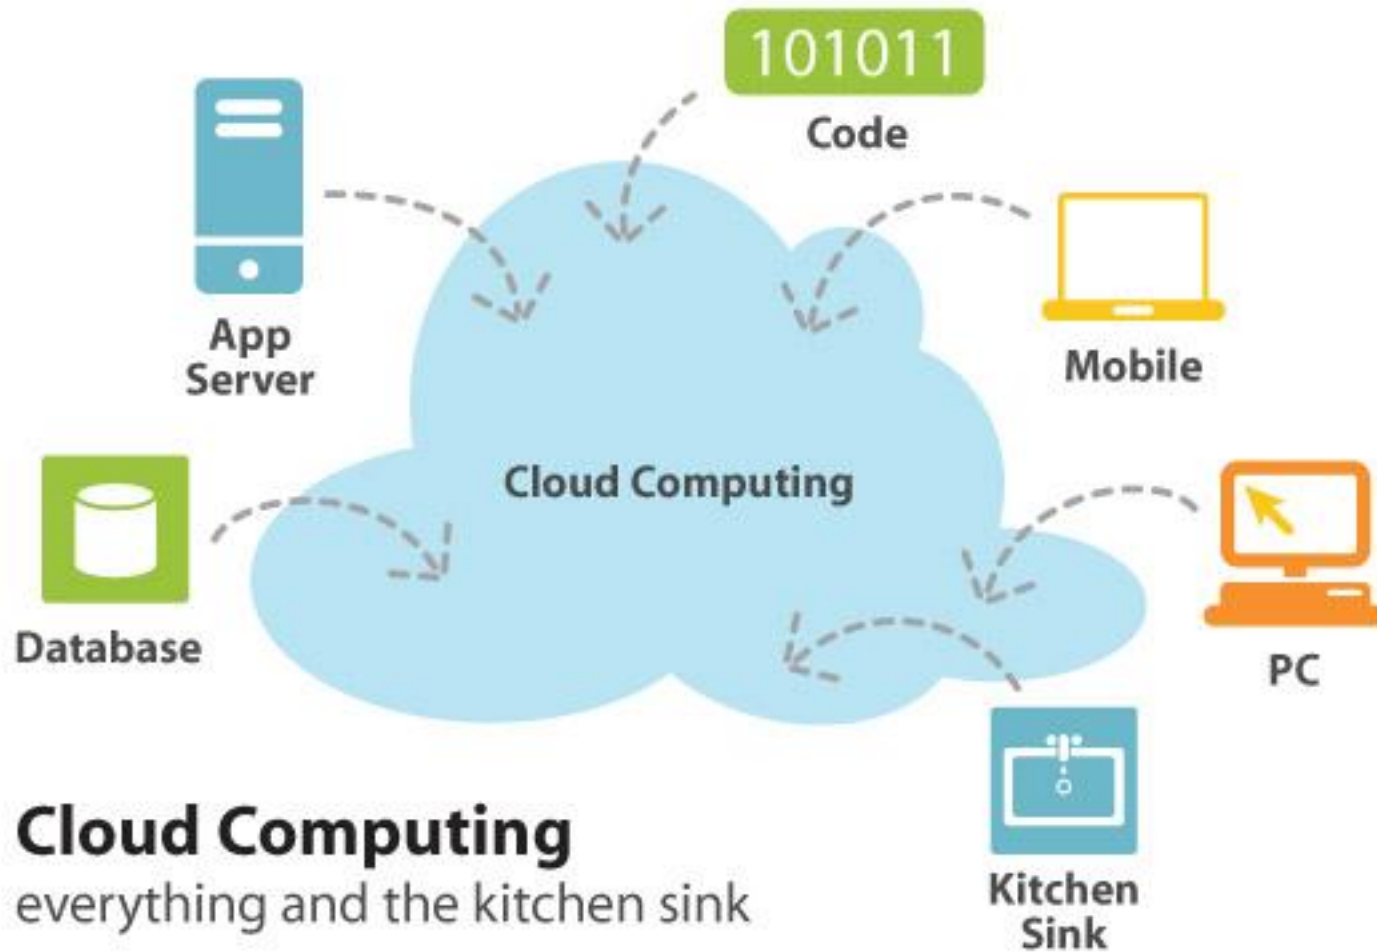

- It is the sum of all of the costs that a customer incurs during the lifetime of a technology solution.
- In the High Performance Computing (HPC) field, the Total Cost of Ownership is normally referred to the data center costs.
- Cost to the owner to build, operate and maintain the data center.
- Cost of Services delivered should be computed taking into account TCO.

# What should be included in the TCO for HPC ?

- Investment, operation and maintenance costs:
  - Hardware: servers, storage, networking, cabling, etc.
  - Electrical equipment: power distribution units, UPS, generators, etc.
  - Cooling systems: air conditioners, water cooling, etc.
- Infrastructure for the data center, power adaptation issues, etc.
- Energy consumption of the hardware and cooling systems
- Software licenses
- Human resources
- Maintenance

HOW can I  
reduce TCO ?

# Cloud computing is the answer ?

# Cloud approach

# The dream

- Cloud computing offers almost unlimited storage and instantly available and scalable computing resources,
- All the above at a reasonable metered cost.. (pay per use)
- However...
  - the use of a typical cloud needs a bit of care..
  - Remote HPC services can range from shared HPC clusters to fully virtualized cloud environments.

# Cloud computing and HPC

“The case for HPC in the cloud is growing stronger, but still has a way to go, especially for the more traditional HPC segments in the public sector”

From <https://www.hpcwire.com/2018/03/15/how-the-cloud-is-falling-short-for-research-computing/>

# HPC on cloud..

- cloud computing represented about 2% of the HPC market by total revenue in 2016.
- About 35% of HPC users make occasional use of public cloud resources.
- A number of vendors already exist within the industry providing HPC in the cloud solutions.

# HPC cloud providers

- AMAZON WEB SERVICES (AWS)
  - <https://aws.amazon.com/it/hpc/>
- MICROSOFT AZURE
  - <https://azure.microsoft.com/it-it/solutions/high-performance-computing/>
- IBM SPECTRUM COMPUTING
  - <https://www.ibm.com/it-it/it-infrastructure/spectrum-computing>
- GOOGLE CLOUD
  - <https://cloud.google.com/solutions/hpc/?hl=it>
- Rescale
  - ....

# Challenges ahead HPC (VI)

- HPC skilled people
- BIG data: no longer HPC but HPDA/AI as well
- Complex and multicomponent HPC systems
- Sustained performance not just HPL !!!
- Energy
- On premises HPC or not ?

# Conclusions

- HPC is about performance but not only
- Supercomputers are clusters !
- Clusters have many different components
- Many challenges ahead to:
  - Use/Exploit a HPC system
  - Plan/ Mantain a HPC system
- There are a lot of other lectures where all what we touch just briefly in this first lecture will be analyzed in details

**Thank you ...**
